

AI Slot Machine Experiment

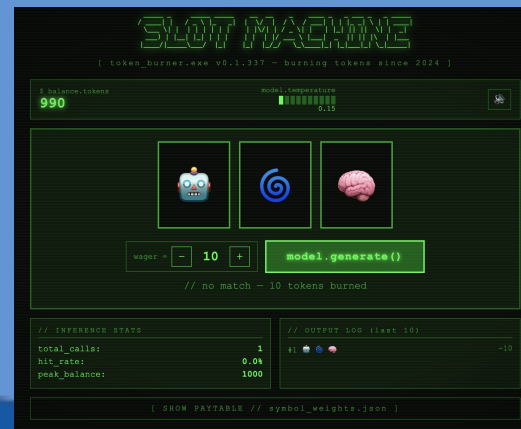

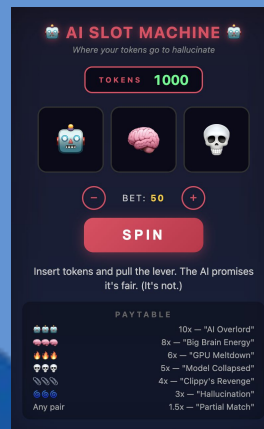

Phase 1 & 2

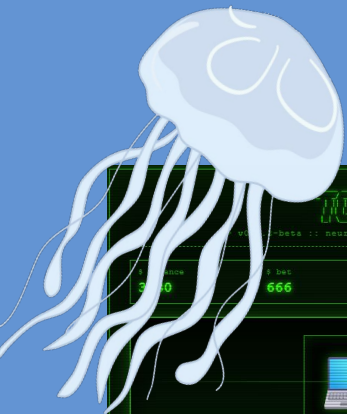

Phase 1

- All 50 candidates showed similar structure and layout
- Some candidates showed variance in terms of features
 - Sound effects
 - “All in” betting option
 - Payout tracking system
 - Animations
- Low code quality: minimal comments and messy lines

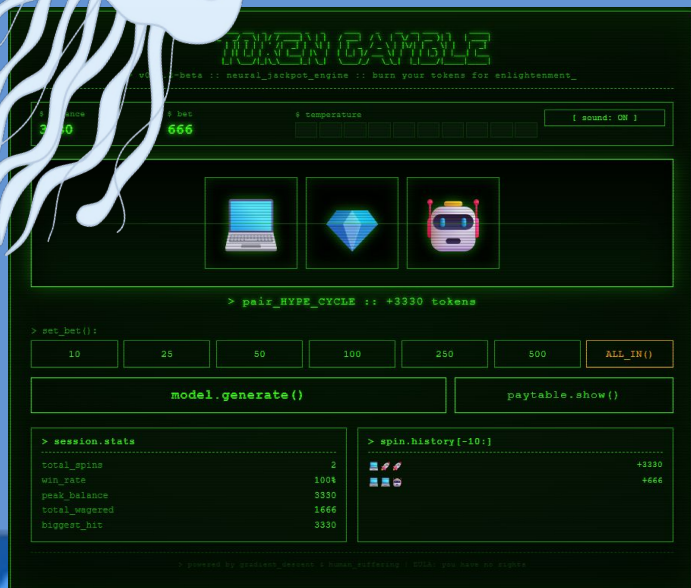

Phase 2

- Built on earlier prototypes, extending key features
- Increased complexity led to a few bugs appearing

Phase 3

- Experienced most bugs during this phase
 - Hypothesis: More complex → more buggy
- Solution: Tweak prompt further (refinement)
- Unique features in top 3:
 - Net loss
 - Bankrupt (losing) screen
 - Winning text visuals
- Cons:
 - Undescriptive code
 - Broken UI/features

Phase 4 & 5

- Unlike previous phases, prompts are created using actual brainstorm in order to combat bugs seen from phase 3
- Tokens output needed increased by as much as 4x times
- Much more features (track log, verticality, failure screen)
- More bugs do appear, especially in the UI

Conclusion

- Longer prompts gave more output and thus many more bugs
- Even through using human-thought prompts for trying to filter out bad bugs, we still ran into some issues with the code and UI
- AI design is very generic and problems persist through iterations. Even though there is overall functionality there are little bugs that appear in many cases
